Research Goals and Objectives

Conceptual Model

Dry Season:
November-March

Wet Season:
March-May and
August-November

**30-40 Meter Height with
Open Understory and
dense subcanopy**

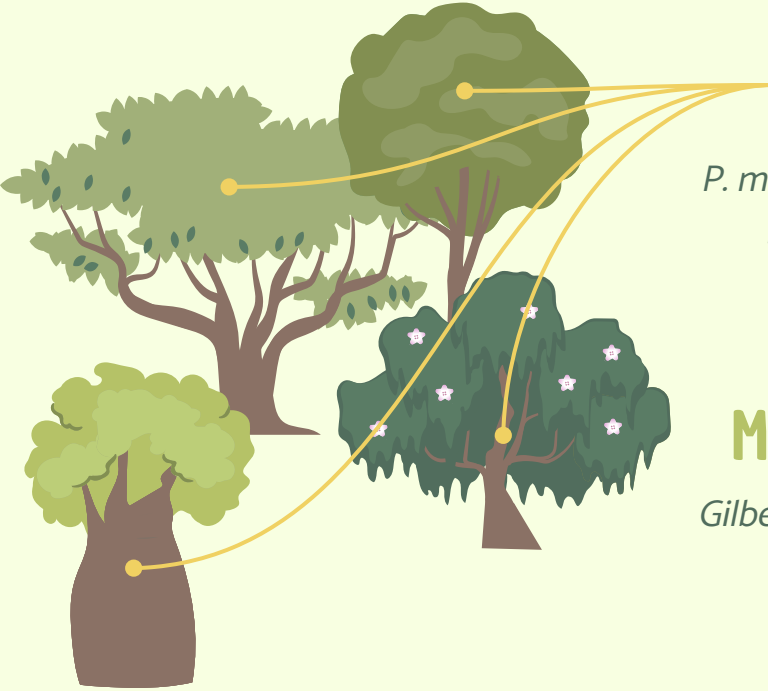

**30-40 Meter
Height with
Dense Canopy**

Gilbertiodendron

**Mixed
Forest**

Forest Composition in the Okapi Wildlife Reserve

MIXED

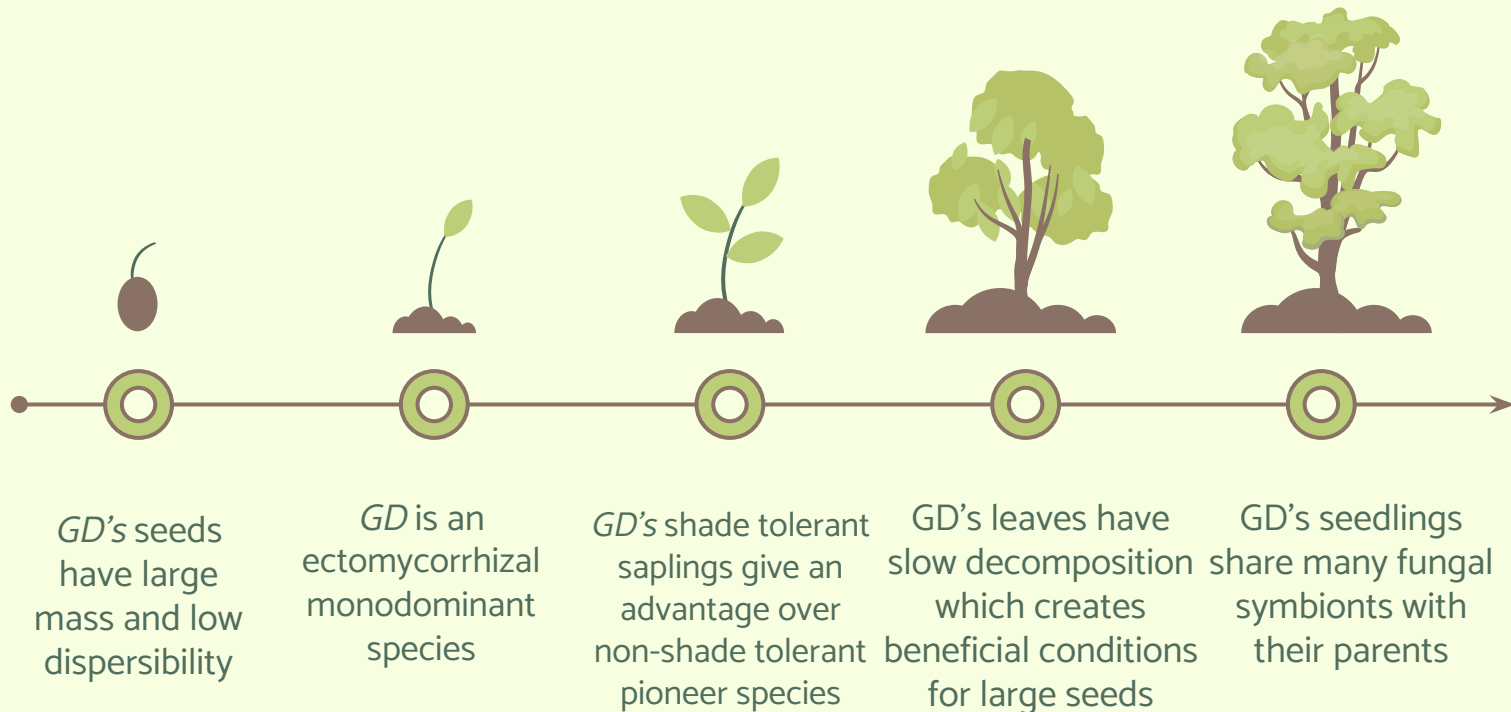

P. macrocarpus, *P. macrophylla*, *C. procera*, *D. glaucecens*, & *E. suaveolens*

MONODOMINANT

Gilbertiodendron Dewevrei (GD)

The Mechanisms for Monodominance in the Trans-Congo Region

Research Goals and Objectives

1. Evaluate different satellite datasets in their ability to discern between monodominant and mixed forest
2. Create a final map that distinguishes forest types
3. Produce an explanation of the methodology for replication by WCS

02

Data and Methods

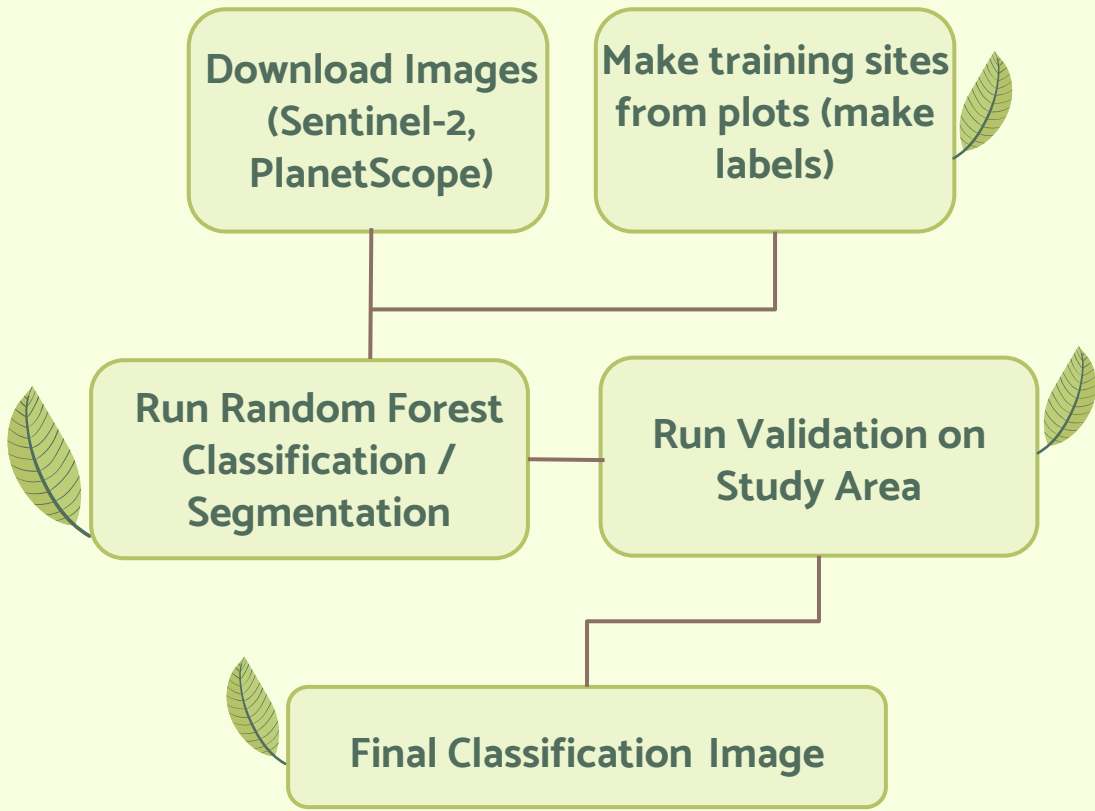

Data Table

| | Description | Type | Spatial Resolution | Temporal Resolution | Spectral Resolution | Source |
|------------------------|--------------------|--------------------|--------------------|---------------------|---------------------|---|
| WCS ground data | Ground sample data | Shapefile (points) | NA | NA | NA | WCS |
| Sentinel-2 | Optional data | raster | 10m - 20m | 5 days | 14 bands | GEE: https://developers.google.com/earth-engine/datasets/catalog/COPERNICUS_S2_SR |
| PlanetScope | Optional data | raster | 3 - 5m | daily | 4 bands | PlanetScope: https://developers.google.com/earth-engine/datasets/catalog/projects_planet-nicfi_assets_basemaps_africa |

Methodology

Month Selection

Sentinel-2 in study area from Jan to Dec, 2022

PlanetScope in study area from Jan to Dec, 2022

March 2022 Images

further
processing

EBOYO FOREST CLASSIFICATION: SENTINEL-2

S-2 DATA FROM: 3/31/2022

0 2.5 5 10 Km

-  Monodominant Forest
-  Mixed Forest
-  Rivers
-  Eboyo

Conclusion and Main Takeaways

Limitations

Striping issue in B1, B2, B3, and B5

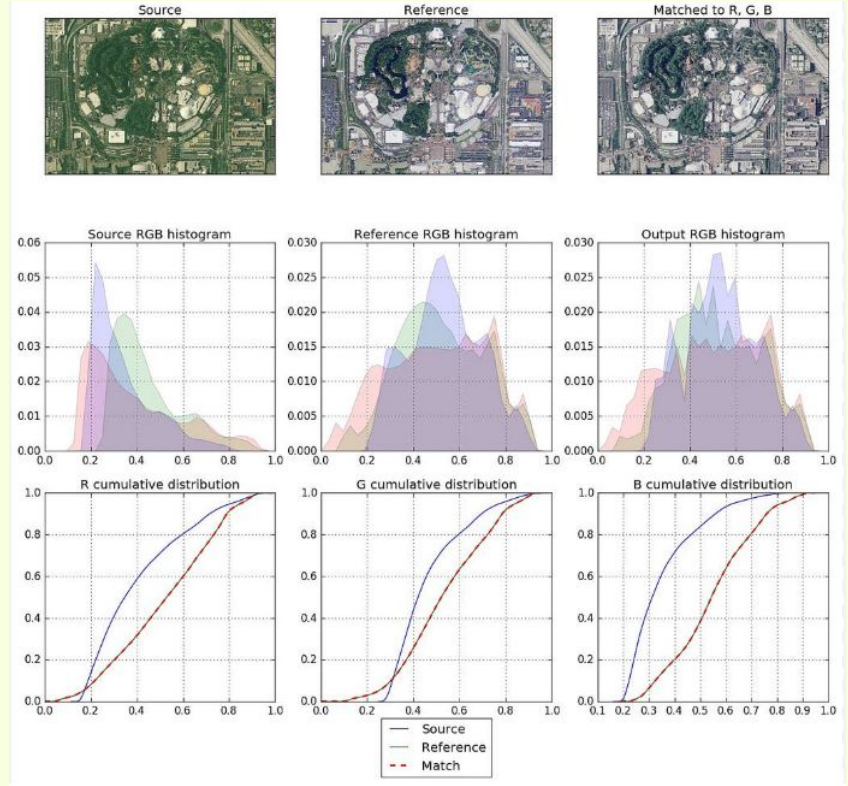

Split Raster issue

Potential Solutions

Segment Anything

Histogram Matching (Demo)

Conclusion

Forest Composition

Sentinel-2:
Monodominant: 32%
Mixed and others: 68%

PlanetScope:
Monodominant: 62%
Mixed and others: 38%

Water and Monodominance

Monodominant forests mostly occur in proximity to rivers and streams.

We found that monodominant forests tend to occur on the opposite of rivers (other environmental factors, the issue of river data)

WCS

Ground sample data.

There are strengths and limitations to analysis, but overall it is possible for WCS to recreate this analysis

Strengths and Limitations of Sentinel-2 and PlanetScope

Sentinel-2

Strengths:

- Free to download, more bands
- Have better classification accuracy

Limitations:

- Image striping issue reduces accuracy of classification
- Difficult to obtain cloud-free images of the entire Okapi area simultaneously

PlanetScope

Strengths:

- Finer resolution, more no-cloud images
- No striping problem

Limitations:

- High data cost
- Tend to overfit and lower the accuracy rate

Future work: Tutorial

Explain How to Reprocess in Other Study Area

Provide Data

- Boundaries
- Ground sample data
- Training Sites Example
- Google Earth Script
- Random Forest Script

Software

- Google Earth Engine
- Collect Earth Online
- ArcGIS Pro
- Terrset
- R

GEE Data

Download Sentinel-2 data March 2022.
Import to ArcGIS pro,
Change Stretch Type to Standard Deviation

Training Sites

Create Random Plot on CEO, Cross Check Basemap and the Sentinel-2 image, and use Create Polygons function in ArcGIS pro

Segment Anything / Histogram Matching

Random Forest

Run Random Forest in R

Validation

Check OOB error rate and estimate Confusion Matrix in R

Segmentation

Spilt the RF output to smaller images.
Use SEGMENTATION in Terrset,
parameters we use:
Window width: 3
Weight mean factor:6
Similarity Tolerance:5
Weight Variance Factor:0.5

Final Classification map
